Design and Analysis of Algorithms CS575 Spring 2024

Theory Assignment 1

Due on 2/22/2023 (Thursday)

Remember to include the following statement at the start of your answers with a signature by the side. "I have done this assignment completely on my own. I have not copied it, nor have I given my solution to anyone else. I understand that if I am involved in plagiarism or cheating I will have to sign an official form that I have cheated and that this form will be stored in my official university record. I also understand that I will receive a grade of 0 for the involved assignment for my first offense and that I will receive a grade of "F" for the course for any additional offense."

Please handwrite or type your answer to each question, scan or save your answers into a pdf file (with a vertical orientation so that we do not need to rotate your file to grade), and upload it to the homework submission site. Please handwrite your answers neatly if you choose to handwrite them. You will not get credits if TAs/graders cannot recognize your handwriting.

1. [20 points] Fill in all the missing values. For column A you need to compute the sums. For column B (the last two rows) you need to guess a function that does not contradict any of the yes/no answers already in the next three columns. Fill in each empty entry in the last three columns with either a yes/no answer.

Function	Function	О	Ω	Θ
A	В	A = O(B)	$A = \Omega(B)$	$A = \Theta(B)$
n^4	$\frac{n^3 \lg n}{n^2}$			
$n\sqrt{n}$	n^2			
(n+1)!	n!			
lg n	n^k where $k > 0$			
$\sum_{i=1}^{n} (i+1) = ?$				yes
$\sum_{i=0}^{n-1} 3^i = ?$		no		

2. [20 points] Prove the following using the original definitions of O, Ω , θ , o, and ω .

(a)
$$7n^3 + 30n^2 + 5n - 9 \in O(n^3)$$

(b)
$$5000n^3 \in \Omega(n^2)$$

(c)
$$20n^3 + 3n^2 \in \omega(n^2)$$

(d)
$$46n^3 \in o(n^4)$$

(e)
$$n^2 + 3n - 10 \in \Theta(n^2)$$

- 3. [15 points] Prove the following using limits.
 - (a) $n^{1/n} \in \Theta(1)$ [Hint: you can use $x=e^{\ln x}$]
 - (b) $3^n \in \omega(n^k)$
 - (c) $lg^3n \in o(n^{0.5})$
- 4. [10 points] Order the functions below by increasing growth rates (no justification required):

$$n^n$$
, n , $n \ln n$, $n^{1/2}$, $2^{\lg n}$, $\ln n$, 10 , $n^{1/n}$, $\sqrt{2}^{\lg n}$, $n!$, $\lg(n^{10})$, 2^n

Let $g_i(n)$ be the *i*th function from the left after the ordering (the leftmost function has the slowest growth rate). In the order, $g_i(n)$ should satisfy $g_i(n) \in O(g_{i+1}(n))$. If two or more functions are equivalent (in terms of Θ), put them in [] separated by comma (e.g., $[n^2, 5n^2]$).

- 5. [20 points] Let f(n) and g(n) be asymptotically positive functions. For each of the following conjectures, either prove it is true or provide a counter example to show it is not true.
 - a. $(f(n) + g(n)) \in \Theta(\max(f(n), g(n)))$.
 - b. $f(n) \in O(g(n))$ implies $2^{f(n)} \in O(2^{g(n)})$.
 - c. $f(n) \in O(g(n))$ implies $g(n) \in \Omega(f(n))$.
 - d. $f(n) \in O(g(n))$ implies $\lg(f(n)) \in O(\lg(g(n)))$, where $\lg(g(n)) \ge 1$ and $f(n) \ge 1$ for sufficiently large n.
- 6. [10 points] Prove that for all integers n>0,

$$\left(\sum_{i=1}^{n} i\right)^2 = \sum_{i=1}^{n} i^3.$$

by mathematical induction. Divide your proof into the three required parts: Induction Base, Induction Hypothesis, and Induction Steps.

7. [15 points] Consider the following algorithm:

```
\begin{array}{lll} \mathbf{for} \, (\, i \, = \, 2\, ; \  \, i \, < = \, n\, ; \  \, i + +) \; \, \{ \\ \mathbf{for} \, (\, j \, = \, 0\, ; \  \, j \, < = \, n) \; \; \{ \\ \mathbf{cout} \, < < \, i \, < < \, j\, ; \\ j \, = \, j \, + \, \lfloor n/4 \rfloor\, ; \\ \} \end{array}
```

- (a) What is the output when n=4?
- (b) What is the time complexity T(n). You may assume that n is divisible by 4.
- 8. [10 points] What is the time complexity T(n) of the nested loops below? For simplicity, you may assume that n is a power of 2. That is, $n = 2^k$ for some positive integer k. Give some justification for your answer.

```
\begin{array}{lll} & \mbox{for } (i = 1; \ i <= n; \ i++) \{ \\ & j = n; \\ & \mbox{while } (j >= 1) \{ \\ & < \mbox{body of the while loop} > \ // \mbox{Needs } \Theta(1). \\ & j = \lfloor j/2 \rfloor; \\ & \} \\ \end{array}
```
